

This depression area in the center of the pad will help anchor the tube while being filled. This area measures 60-foot-long x 8-foot wide

Sediment containment tube wood chip pad will measure 35 feet wide x 110 feet long and must be level side to side and end to end. The height of wood chips will need to be 12 to 18 inches to compensate for grade fall. Total cubic yards of wood chips needed will depend on the grade fall. The depression area can be 8 to 12-inches lower than the top of the flat and level pad. Total cubic yards of wood chip needed will depend on the grade fall. This is an overhead view. The pad will have a 5-foot shoulder on all sides.

Sketch for one *60-foot x 100-foot sediment containment tube, created by Sediment Removal System

*This number represents the circumference of the sediment tube not its actual width on the ground.
